MacOS Catalina Installation instructions

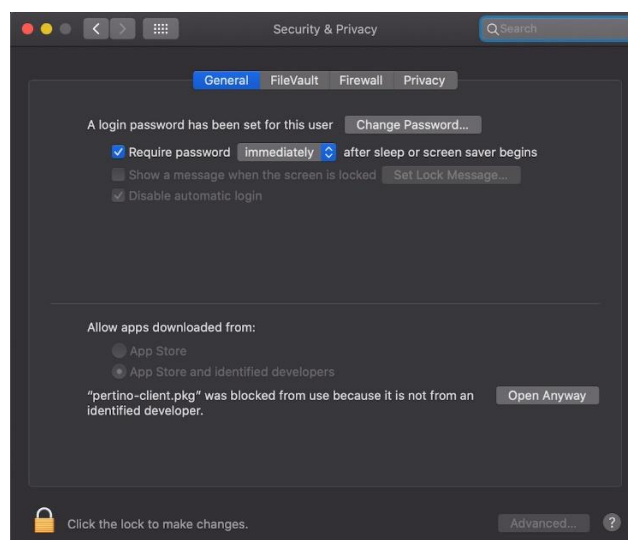

MacOS Catalina has introduced additional security checks. All apps need to be Notarization from Apple. We have Notarized the latest NCP Application and the Notarization token has been embedded by Apple. In order to install the NCP Client, you will need to manually verify the source for the app to be installed.

The steps required for verification on MacOS Catalina are outlined below:

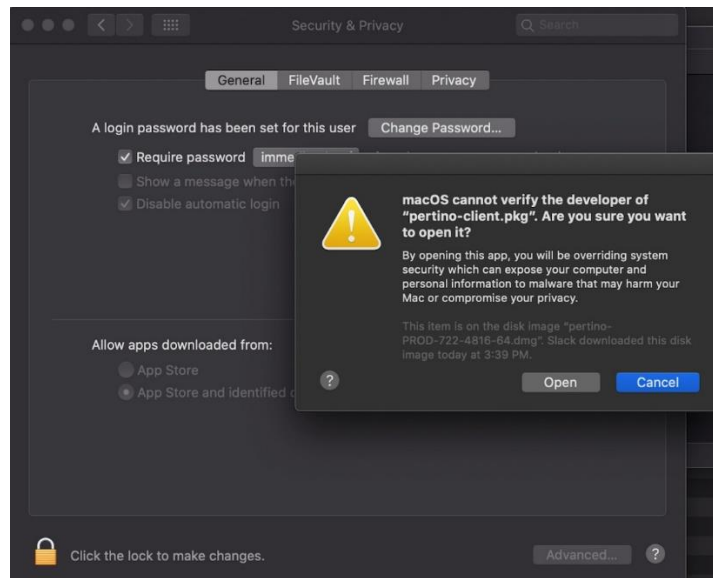

- Download the NCP macOS client from the official Cradlepoint downloads page (<https://cradlepoint.com/downloads>)
- Open the DMG
- Open the pertino-client.pkg, you will see a pop-up indicating this is an unidentified developer, click on ok.

- Navigate to System Preference → Security & Privacy → General and click on 'Open Anyway'

- There will be another pop-up, click on 'Open' again

- Select 'OK' and then your NCP client will be running.
